

FACT SHEET

Asset Classes

Introduction

An asset is anything that can be bought, sold or exchanged and an asset class is simply a category or class of asset. The traditional asset classes are cash, bonds and shares but other asset classes include commodities such as copper and oil, commercial property and art. The investor can choose whether to invest directly in an asset class, for example by buying shares or indirectly through an investment fund. An investment fund pools money from many investors enabling investors to share the cost of investing and to spread the risk.

When advising on asset allocation, we are looking to diversify over asset classes that are not directly correlated. By this we mean that they do not react in the same way and by responding differently, reduce volatility. For example, Shares and Commercial Property with the exception of 2008, are not directly correlated. On the other hand UK and Overseas Shares whilst separate asset classes tend to be correlated so by spreading your investment between UK and Overseas Shares, you are diversifying your Portfolio but not in practice reducing the risk.

When advising on investment we are looking to diversify asset allocation in an attempt to provide a margin over cash on deposit known as the risk premium. The risk premium must be worthwhile otherwise you would retain cash on deposit.

Cash

Cash investments earn money through interest which can be paid out on a fixed or variable rate. Cash is suitable for the short term because it is secure and offers ease of access.

In addition to bank and building society deposit accounts, cash investments include certificates of deposit and treasury bills.

Cash investments are highly predictable and in a diversified portfolio can help offset the volatility of other asset classes such as shares. The down side is that returns are generally lower than those of either bonds or shares and may not keep pace with inflation over the medium to long term.

Bonds

A bond is also known as a 'fixed interest' investment. It represents a loan made to a government or company. In return for your money the borrower agrees to pay a specified rate of interest and to repay the amount of the loan at the end of a pre-agreed period, the redemption or maturity date.

Government bonds are considered the safest type of bond as they are backed by government guarantees and are generally easy to buy and sell. Bonds issued by the UK government are known as 'gilt edged securities' or 'gilts'. Historically, the returns have not been as high as those afforded by corporate bonds.

Corporate bonds are issued by companies to finance or expand their business. Generally they offer higher returns than government bonds but also carry a higher level of risk.

Bonds are traded in much the same way as shares. The interest the bond pays, called the 'coupon', is usually a fixed percentage of the price at which the bond was originally issued. During its lifetime the bond can be traded. The capital value will be driven by demand which is in turn driven by two factors, interest rates and the credit worthiness of the bond issuer. For example, if the bond guarantees to pay out 5% per year and interest rates are only 3%, the bond is more likely to be in demand. But if interest rates rise to 7%, the bond will no longer be in demand so its capital value will fall. The capital value also depends on the credit-worthiness of the issuer.

Bonds can offer a steady and predictable income stream as well as security of capital if held to maturity and the issuer does not default. Bonds are, however, susceptible to fluctuation in interest rates. When interest rates rise, bond prices tend to fall and vice versa.

Shares

When you buy a share you become a part owner of the company and may have the right to vote on key decisions and also to share in profits through the payment of dividends. High yielding Shares seek to pay above average Dividends. You can invest in shares at home and overseas. Over the long term shares have out-performed bonds, commercial property and cash investments but are the most volatile asset class.

If a share is in demand, perhaps because its profits are rising, the price of the share will go up. Companies also reward investors by paying a proportion of profits to shareholders in the form of a dividend. Conversely, if a company's profits fall, it will reduce or suspend payment of dividend and generally its share price may fall as there will be more sellers than buyers.

So to summarise, shares have historically out-performed other asset classes and can provide a combination of income through dividend payment and capital growth. However, shares can be volatile and the value of shares can go down as well as up meaning you might not get back the amount you originally invested. There is also a chance that a company might fail.

Commodities

Commodities are raw materials to include:-

- Energy – oil and natural gas
- Base and precious metals – gold, platinum and silver
- Agricultural – corn, soya bean, wheat.
- Industrial - cotton and copper
- Soft commodities – cocoa, coffee, sugar.

Commodities can be a very effective means of diversifying risk and reducing volatility because they move differently from shares and bonds, so commodities are “negatively correlated.”

Property

Property has grown in popularity on the back of a strong housing market. As an asset class, however, property usually refers to commercial property such as shops, offices and retail parks. Commercial property can provide an income from letting as well as capital growth.

Capital returns from property have been higher than from bonds. Rental income is general slightly lower than the income yield paid on corporate bonds. Like commodities, commercial property tends to be negatively correlated with equities and bonds which means that property can still increase in value when equity and bond markets are falling. The down side is that property is a relatively illiquid asset that may prove difficult to sell and transactional costs are high.

Exposure to Property can be achieved by investing directly, or indirectly by buying Shares in an Investment Fund.

Hedge funds

Hedge funds do not represent an asset class such as shares and bonds. Instead they are a type of investment product that can include many asset classes. Generally, hedge funds seek out investments that appear to be wrongly priced and aim to produce positive returns in all types of market environment. Hedge funds seek to protect the investor when there is sharp downward movement in the market. Hedge funds are flexible and focus on generating positive returns consistently. They are, however, very dependent on the skills of the manager. Furthermore, fees are performance related and can be high when the fund is performing well.
